MACHINE LEARNING				
Course Code: MCS-101	Credits: 4			
Contact Hours: L-3 T-0 P-2	Semester: 1			
Course Category: DCC				

Introduction:

Machine learning (ML) is the science of getting computers to act without being explicitly programmed. Many researchers also think it is the best way to make progress towards human-level AI. This course provides a broad introduction to machine learning, data mining, and statistical pattern recognition.

Course Objectives:

- To provide an introduction to the basic principles, techniques, and applications of ML.
- To explain the strengths and weaknesses of different machine learning algorithms (relative to thecharacteristics of the application domain)
- To be able to adapt or combine some of the key elements of existing machine learning algorithms to design new algorithms as needed.

Pre-requisites:

Knowledge of programming, basic probability theory and statistics

Course Outcomes: After completion of the course, student will be able to:

CO1: Understand and apply the basic concepts of machine learning, gradient descent, regression techniques and support vector machine.

CO2: Understand, apply, and analyse various dimension reduction techniques, neural networks, decision trees and ensemble learning

CO3: Understand, apply, and evaluate KNN and Bayesian classifiers.

CO4: Understand and apply various unsupervised learning techniques and reinforcement learning techniques

Pedagogy:

The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, web-based resources as well as flipped class room teaching will be adopted.

UNIT-I	12 Hours

2011.

Advanced Database Management System			
Course Code: MAI 101	Credits: 4		
Contact Hours: L-3 T-0 P-2	Semester: 1		
Course Category: DCC			

Introduction

This course covers advanced aspects of database management including query optimization, distributed databases, data warehousing and data mining. There is extensive coverage and hands on work with SQL, and database instance tuning. Course covers various modern database architectures. Students learn about unstructured databases, and gain hands-on experience with MongoDB.

Course Objectives

- To give knowledge of distributed and Parallel database systems
- To know various database architectures and its implementation
- To know Query processing and optimization

Pre-requisite: Knowledge of Data Base Management Systems

Course Outcome: After studying this course students will be able to :

CO1: Understand how transactions are processed in a database.

CO2: Implement concepts of Object-Oriented database.

CO3: Tune and optimize some database applications.

CO4: Understand and analyze modern data processing paradigm such as NoSQL

Pedagogy: The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, web-based resources as well as flipped class room teaching will be adopted.

	10 Hours
Review of SQL, PL/SQL, Cursors and parameters, Exception Handling, procedures and	functions,
packages, Triggers, Improving PL/SQL performance.	
Obstacles to scaling up RDBMS, Difference between parallel and federated data bases.	
Parallel databases, performance parameters: response time, speed up and scale up, j	barallel database
architectures, query evaluation, virtualization	
UNIT II	10 Hours
Distributed data bases: Peer-to-peer and master slave allocation, consistency models	and replication
issues, ACID versus BASE, vertical, horizontal, and hybrid fragmentation, query of	optimization in
distributed data bases	
Limitations of the relational model, Schema on read versus schema on write, Complex data	arrays, tuples,
bags, sets, lists.	
XML data bases: XML document structure, XML schema and schema design strategies, 2	<u> </u>
UNIT III	12 Hours
The MongoDB data store: master slave architecture, consistency, replication and availabi	lity in MongoDb,
Data Types, Arrays, Embedded Documents. Data modelling issues, Document identity, to	emporal issues in
MongoDB, Indexing in MongoDB, Querying with MongoDB, Comparison with XML da	ta bases.
Column versus row-oriented querying, The notion of columns and column families, Th	
store, nodes, clusters and allocation, consistency, replication, and availability. Cassa	
Query-oriented data modelling in Cassandra, Indexing, Querying using CQL, Compariso	n with relational
and document stores.	1
UNIT IV	
	10 Hours

MATHEMATICAL FOUNDATIONS FOR DATA SCIENCE

Course Code: MAI-103 Contact Hours: L-3 T-0 P-2 Course Category: DCC

Credits: 4 Semester: 1

Introduction: Learn about the need for data science, with emphasis on data visualization in data science.

Course Objective:

- To introduce the basic statistical formulae and visualization techniques
- To comprehend the concepts of probability, probability distribution and linear algebra
- To understand the concepts of sampling, sampling distribution and estimation
- To understand the concept of hypothesis testing

Pre-requisite: Knowledge of basics of probability

Course Outcome: At the end of the course students will be

CO1: Understand statistical formulae, visualization techniques and linear algebra concepts

CO2: Solve the real-life problem using the probability theory and linear algebra

CO3: Analyze the problem to predict the solution using the estimation theory for given samples **CO4:** Develop a model using constraint and unconstrained optimization techniques.

Pedagogy: The teaching-learning of the course would be organized through lectures, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, webbased resources as well as flipped class room teaching will be adopted.

	UNIT I	12 Hours
and c	cs of Data Science: Introduction; Typology of problems; Importance of linear algeb optimization from a data science perspective; Structured thinking for solving data sc lems. The role of statistics, numerical and graphical methods for describing and sur	cience
	UNIT II	10 Hours
and	ear Algebra: Matrices and their properties (determinants, traces, rank, nullity, etc. eigenvectors; Matrix factorizations; Inner products; Distance measures; Projecti erplanes; half-planes.	
	UNIT III	10 Hours
unde expe Distr	ability and Probability distribution: Basic terminology in probability and rules, Pro or conditions of statistical independence and dependence, Bayes Theorem. Random cted values, variance, probability distributions, model given data. Sampling a ributions: introduction to sampling, random sampling, non-random sampling, sampli e mean, sampling distribution of the proportion, T-distribution.	variables, and Sampling
	UNIT IV	10 Hours
desce Intro Data	mization: Unconstrained optimization; Necessary and sufficiency conditions for op ent methods; Constrained optimization, KKT conditions; Introduction to non-gradie duction to least squares optimization; Optimization view of machine learning. ADVANCED DATA STRUCTURES AND ALGORITHMS

С	ourse Code: MCS 105	Credits: 4
C	Contact Hours: L-3 T-0 P-2	Semester: 1
C	ourse Category: DCC	

Introduction: This course is about teaching of various data structure designs & its implementations, analyzing the various algorithm strategies and designing of new algorithmsfor various classes of problems. It is intended to be a gentle introduction to how we specify data structure, algorithms, some of the design strategies, and many of the fundamental ideas used in algorithm analysis throughout the syllabus.

Course Objective:

- To build an understanding on the basics of core and advance data structure.
- To introduce the various strategies used in the algorithm design and their analysis.
- To teach the selection of data structure for a particular problem
- To teach students, how to write complex program using dynamic data structures

Pre-requisite: Students should have some programming experience. In particular, they should understand recursive procedures and simple data structures such as arrays and linked lists. Students should have some facility with proofs by mathematical induction.

Course Outcome: After studying this course, Students will be able to:

CO1: Successfully design and implements the core and advance data structures

CO2: Successfully analyses the complexity associated with the various data structures

CO3: Analyse, design and implements the various proposed algorithm based on different algorithmic strategies.

CO4: Choose data structures for various complex problems

Pedagogy : The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, web-based resources as well as flipped class room teaching will be adopted.

INTELLIGENT DATA AND INFORMATION RETRIEVAL

Course Code: MCS-103 Contact Hours: L-3 T-0 P-2 Course Category: ROC

Semester: 2

Credits: 4

Introduction: Intelligent Data and Information Retrieval aims to provide application of various concepts of artificial intelligence for organizing& fetching data and information from the internet databases like search Engines. The Subject will introduce various types Intelligent data storage and processing techniques and also how to intelligently retrieve data from web sources so that the results of queries are exact and efficient.

Course Objectives:

- To understand the concepts of intelligently organizing data and fetching data from queries.
- To learn the different models for information storage and retrieval.
- To understand indexing and querying in information retrieval systems.
- To learn techniques for intelligently retrieving information from web search

Pre-requisites: Knowledge of basic databases and algorithms

Course Outcomes: Having successfully completed this course, the student will be able to

CO1: Able to organize data intelligently and fetch using FSQL

CO2: Deduce inferences from stored databases

CO3: Design algorithms for retrieving information effectively.

CO4: Retrieve information efficiently from web

Pedagogy: The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, web-based resources as well as flipped class room teaching will be adopted.

UNIT I **12 Hours** Introduction: Introduction to data and various database Models. Data v/s information. Fuzzy Databases- Type-1 and Type-2 Fuzzy Relational Databases. Fuzzy Functional Dependency and Fuzzy Multivalued Dependency. Intelligent Query Processing using FSQL. Case studies of Fuzzy Databases. **UNIT II 10 Hours** Deductive Databases- Overview of Deductive databases, datalogue notations, Clausal Forms and Horn clauses, Interpretation of Rules, datalogue programs-safety issues, use of relational operators, non-recursive queries, Evaluation of Non-recursive datalogue queries. Case studies of deductive databases UNIT III **10 Hours** Information Retrieval: Introduction of IR. Comparison between databases and IR Systems. Generic IR pipeline. Retrieval Models- Boolean Model, Vector Space Model, Probabilistic Model, Semantic Model, Fuzzy Model.Wrappers. Relevance feedback, Evaluation Measures-Precision, Recall and F-Score. Fuzzy Queries based development of Question Answering systems, Error detection and correction. UNIT IV 10 Hours Web Search and Analysis: PageRank Algorithm, HITS algorithm. Webcontent Analysis, ontology based IR. Intelligent Web Agents. Social Search- Collaborative and conversational. Query Expansion using Fuzzy operators. Case studies:-Development of MetaSearch Engine using intelligent operators like OWA, Web crawlers, web spamming, web analytics. **Text Books:** David A. AGENT BASED INTELLIGENT SYSTEM

Course Code: MCS 107	Credits: 4
Contact Hours: L-3 T-0 P-2	Semester: 1
Course Category: DEC	

Introduction: Agent based intelligent system provides fundamental concepts and techniques of intelligent systems. This also provides detail insight into representation and interpretation of knowledge on a computer. Several search strategies also called algorithms and control has described.

Course Objectives:

- Understand the structure of agents and define several learning mechanisms of agents.
- Dealt with the communication and cooperation within agents.
- Design the agents by learning how to plan and design the actors in the real world.

Pre-requisite: The student should have studied Data structure and algorithms with any programming language.

Course Outcomes:

CO1: Develop a computational agent with various searching techniques.

CO2: Apply the reasoning mechanisms of proposition and predicate logic to agents.

CO3: Use the learning mechanisms for an artificial agent.

CO4: Planning and acting in the Real world and logic-based agents.

Pedagogy:

The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, web-based resources as well as flipped class room teaching will be adopted.

AI BASED PROGRAMMING TOOLS		
Course Code: MCS 109	Credits: 4	
Contact Hours: L-3 T-0 P-2	Semester: 1	
Course Category: DEC		

Introduction: Artificial intelligence is widely applied to solve real world problems. Different programming languages are used for implementing AI programs. Now, many reusable tools are also available for facilitating the programming. These reusable tools and programminglanguages are taught in this course.

Course Objectives: This subject aims at teaching languages used for programming of AI applications. Programming tools play an important role in problems solving through Artificial intelligence methodology. It deals with all aspects of AI programming languages.

Pre-requisite: Students should have studied basic course on Artificial Intelligence and should be aware about the procedure of problem solving through AI.

Course Outcomes: After studying this course, students will be able to:

CO1: Understand the various programming languages to be used for AI and its applications.

CO2: Understand and implement the basics of python programming languages and its API for AI.

CO3: Understand the advance concepts of python including database management systems.

CO4: Understand and use the R programming language and packages for AI.

Pedagogy:

The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, web-based resources as well as flipped class room teaching will be adopted.

	UNIT I	10 Hours	
Cor mat	Introduction : Concept of AI programming Tools. Concept of Logic Based Programmin Conventional AI Programming languages: Overview of LISP, Search Strategies in LISP, Patte matching in LISP, Shell concept in LISP, Over view of Prolog, Production System Using Prolo Writing programs using LISP and PROLOG.		
	UNIT II	10 Hours	
Concepts of Python Programming: Feature of python Program, Functions and Modules Function Definition, Function Call, Variable Scope and lifetime, The return Statement, Lambda Function or Anonymous Functions, Recursive Functions, Modules, Package in Python. Tensor Flow, Pytorch.			
	UNIT III	10 Hours	
and Imp	Advance Features of Python: File Handling Using PythonFile Path, Types of Files, Opening and Closing Files, Reading and Writing Files, File Positions, Renaming and Deleting Files. Implementing object-oriented Programming concepts using Python. Creating databases using Python.		
	UNIT IV	10 Hours	
Paci Fran Dat	Concepts of R Programming: Data Types and Operations, Flow Control, Introduction to R-Packages, Scientific Calculator Inspecting Variables, Vectors Matrices and Arrays- Lists and Data Frames, Functions & Package Strings and Factors- Flow Control and Loops- Advanced Looping-Date and Times, Charts & Graphs, Connecting R to External Interface, Elementary statistics, tests of Hypotheses.

KNOWLEDGE ENGINEERING		
Course Code: MCS 111	Credits: 4	
Contact Hours: L-3 T-0 P-2	Semester: 1	
Course Category: DEC		

Introduction: This subject aims at handling different technical aspects of knowledge. Knowledge plays an important role in solving problems through Artificial intelligence methodology. This is advanced course and aims at teaching issues related with identifications, representation and storing knowledge.

Course objectives: This course aims at teaching students about importance of identification of knowledge. It teaches the technical methods to represent and use knowledge using inferencing. To teach students about acquisition of knowledge and related concepts.

Pre-requisite: Students should have studied basic course on artificial intelligence and should be aware about the procedure about problem solving through AI

Course Outcome: After studying this subject, students would be able to:

CO1: Identify basic components and types of knowledge.

CO2: Understand various knowledge representation methods.

CO3: Devise computer structures to store knowledge.

CO4: Understand development of knowledge intensive systems.

Pedagogy:

The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, web-based resources as well as flipped class room teaching will be adopted.

UNIT I 10 Hours		
Introduction: Concept of Knowledge Engineering, Knowledge Economy, Knowledge Management		
vs Knowledge Engineering, Knowledge Engineering and Artificial Intelligence, Terminology related		
with Knowledge Engineering, Concept of Knowledge Reuse. Concept of Knowledgebase Intensive		
Systems and Development of elementary Knowledge Based System		
UNIT II 11 Hours		
Knowledge Acquisition and Knowledge Manipulation. Basic features of Knowledge		
Acquisition. Challenges in identification of Tacit Knowledge, Acquisition of Domain		
Knowledge, and Contextual Knowledge, Process of identification of explicit knowledge related		
to specific real- w o r l d problems. Acquisition of static and dynamic knowledge. Concept of		
Knowledge Manipulation, Basic principles of Inferencing, Methods of inferencing, Forward		
chaining, Backward chaining, bidirectional chaining, Factors that decides the direction of		
inferencing, Drawing Conclusion using Inferencing.		
UNIT III 11 Hours		
Knowledge Management: Use and Reuse of Knowledge, Knowledge Management Overview,		
Knowledge Conversion, Knowledge Management Roles, Implications of Knowledge Management.		
UNIT IV 11 Hours		
Expert System Design: Concept of Expert System, Application Domain of Expert System, Basic		
components of an Expert Systems, Design Methodologies of Expert Systems, Designing of		
inferencing module, and Input / output module. Design methodologies of Knowledge bases used		
in expert systems.

Advanced Machine Learning		
Course Code: MAI-102 Contact Hours: L-3 T-0 P-2 Course Category: DCC	Credits: 4 Semester: 2	

Introduction: Machine learning is a subset of Artificial Intelligence (AI) which provides machines the ability to learn automatically & improve from experience without being explicitly programmed to do so. In the sense, it is the practice of getting Machines to solve problems by gaining the ability to think.

Course Objectives:

- To provide an overview of ML techniques and its applications.
- To familiarize with the working Neural Networks including activation functions.
- To provide the understanding on the class imbalance problem and different sampling techniques.
- To provide insights of evaluating different machine learning algorithms using various performance metrics.

Pre-requisite: Basic Knowledge of programming.

Course Outcomes: After completion of the course, student will be able to:

- CO1: Identify potential applications of machine learning in practice.
- CO2: Represent your data as features to serve as input to machine learning models.
- **CO3:** Assess the model quality in terms of relevant error metrics for each task.

CO4: Utilize a dataset to fit a model to analyze new data.

CO5: Build an end-to-end application in Python that uses these machine learning techniques

Pedagogy: The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, web-based resources as well as flipped class room teaching will be adopted.

	UNIT -I	10 Hours	
Data	Data visualization: Interpretation and visualization using python programming and reporting		
	esults, comparing different ML algorithms.		
Samp	Sampling and Estimation: Sample vs Population, Sampling techniques- simple, stratified.

Deep Learning		
Course Code: MCS-102	Credits: 4	
Contact Hours: L-3 T-0 P-2	Semester: 2	
Course Category: DCC		

Introduction: Deep Learning has received a lot of attention over the past few years to solve a wide range of problems in Computer Vision and Natural Language Processing. Neural networks form the basis of deep learning. This course intends to cover fundamentals of neural networks, deep learning and application areas.

Course Objectives:

- To understand basic Neural Network Models, Learning and applications of Neural Network.
- To learn about the building blocks used in Deep Learning based solutions.
- To Introduce major deep learning algorithms, the problem settings, and their applications to solve real world problems

Pre-requisite: Working knowledge of Linear Algebra, Probability Theory and Machine Learning

Course Outcomes: On successful completion of the course, students will be able to:

CO1: Understand and apply the basic concepts of Neural Networks and gradient descent.CO2: Understand and apply various regularization techniques, PCA, SVD and Autoencoders.CO3: Understand, apply, and evaluate CNN, RNN and encoder decoder modelsCO4: Understand and apply LSTM, Resstricted Boltzman Machine and transformer models

Pedagogy: The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Students would be encouraged to develop an understanding and implementation of various neural network and deep learning algorithms for real world problems. Use of ICT and web-based sources by using blended mode will beadopted.

UNIT -I	10 Hours		
History of Deep Learning, Deep Learning Success Stories, McCulloch	Pitts Neuron,

Research Methodology and Publication Ethics		
redits: 4		
emester: 2		
1		

Introduction: An M.Tech/Ph. D. may become an Instructor/Mentor/Facilitator in an Academic Institute or a Researcher in some Industry/Institute. This course is a foundation to let her optimize the time spent in research during and after M.Tech/Ph. D programme.

Course Objectives:

- To familiarize with the various steps in research.
- To familiarize with global standards in research world.
- To familiarize with global & domestic industry trends
- To familiarize with Product oriented research
- To enable the student to think rationally to formulate and solve a problem to the ultimate benefit of the society and welfare of mankind

Pre-requisite: None.

Course Outcomes: Having successfully completed this course, the student will be able to

CO1: Gain knowledge and comprehend various fundamentals of research.

CO2: Build a sound foundation of methodologies and applications of research.

CO3: Identify and analyze relationship between technical/multidisciplinary areas and integrate them for various applications.

CO4: Evaluate and apply the quantitative and qualitative aspects of research to innovate devices and processes in the constantly competitive Technologies.

CO5: Identify and evaluate the Cross functional coalition aspects.

CO6: Know how on how to take research to a product implementation.

Pedagogy: The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, web-based resources as well as flipped class room teaching will be adopted.

	UNIT -I	10 Hours

Natural Language Processing		
Course Code: MCS-104 Contact Hours: L-3 T-0 P-2 Course Category: DEC	Credits: 4 Semester: 2	

Introduction: Natural Language Processing is a branch of Artificial Intelligence which deals with processing of Natural Language Text with the help of AI and Machine Learning Techniques. All Social Networking sites and Search Engines have to rely on NLP Techniques for efficient processing. This course will focus on discussing various phases of NLP for processing text in different language with a focus on English and Hindi Language.

Course Objectives:

- Understand various phases of NLP
- Learn the various applications of NLP
- Solve various real-world problems and Case studies, with a special focus on English Language and Hindi Language.

Pre-requisite: The student should have studied Fundamentals of Data Mining and Artificial Intelligence.

Course Outcomes: After completion of the course, student will be able to:

CO1: Understand the Various phases of Natural Language Processing.

CO2: Understand deploying various applications of Text Processing.

CO3: Process Text of different Languages to draw useful inferences

CO4: Develop AI based Applications of NLP.

Pedagogy:

The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, web-based resources as well as flipped class room teaching will be adopted.

Applications	s of AI in IoT
Course Code: MAI-104 Contact Hours: L-3 T-0 P-2 Course Category: DEC	Credits: 4 Semester: 2

Introduction: Internet of Things is the new technology emerging in every domain such as transportation, smart home, smart city, smart agriculture, robotics etc. In this course architecture of the IoT systems are taught. It also deals with IoT interfaces for various applications and its networking protocols in order to develop efficient systems. n this course Design and development of IoT based application for real world applications will also be covered.

Course Objectives: This course aims at understanding of IoT, its architecture and applications development for solving real world problems, Network and IoT protocols and its Application development, Interfacing of various sensors, IO devices and data processing and Development of AI based IoT Application Development.

Pre-requisite: The student should have studied Fundamentals of Computer/ Computer organization and any programming language.

Course Outcomes: After studying this course students will be able to:

CO1: Identify a real world problem and design a solution for solving the same using the concepts of IOT

CO2: Develop Interface of various sensors, I/O devices and I/O peripherals with N /W Protocols

CO3: Implement AI based/ IoT based Mobile Application Development

CO4: Deploy and test the solution designed

Pedagogy: The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, web-based resources as well as flipped class room teaching will be adopted.

UNIT -I	11 Hours	
Introduction to IoT: Architectural Overview of IoT: Components of IoT, Block Diagram, Design principles.		
Applications of IoT and its Infrastructure: AI Applications in IoT, Sensing, Actuation, Devices,		
Gateways. Introduction to IoT Programming Environments and Languages	s. Data Management,	
Business Processes in IoT.	_	
UNIT- II	11 Hours	
IoT Interfacing: Component selection criterion for Implementing IoT ap	plication, Hardware	
Components- Computing (NodeMCU, Raspberry Pi), Communication, Ser	nsing, Actuation, I/O	
interfaces. Software Components- Programming API's (using Python).	Sensors interfacing:	
Interfacing of Temperature, humidity, light, accelerometer, ultrasonic, l	IR/PIR, Camera etc.	
Communication and I/O components Interfacing: Bluetooth, WiFi, GSM, sensor etc.	, Displays and touch	
UNIT-III	10 Hours	
IoT Networking: Basics of Networking, Design Principles for the Web Co	onnectivity for	
connected- Devices, PHY/MAC layer: IEEE 802.11, IEEE 802.15, Zig		
energy, Wi-Fi. Network layer: IPv4, IPv6. Transport Layer: TCP, UDP		
HTTP, CoAP, XMPP.		
UNIT- IV	10 Hours	
AI based IoT Application Development: Solution framework for	IoT applications-	
Implementation of Device integration, Data acquisition, Organization	and integration and	
analytics. Device data storage- Unstructured data storage on cloud/local ser	over, authorization of	
devices, role of Cloud in IoT, Security aspects in IoT. Case Study: Smart C	Cities, Smart Homes,	
Automobiles, Industrial IoT, Agriculture etc.

Big Da	ta Analytics
Course Code: MCS-110	Credits: 4
Contact Hours: L-3 T-0 P-2	Semester: 2
Course Category: DEC	

Introduction: The explosion of social media and the computerization of every aspect of social and economic activity resulted in creation of large volumes of mostly unstructured data: web logs, videos, speech recordings, photographs, e-mails, Tweets, and similar. Today, we have the ability to reliably and cheaply store huge volumes of data, efficiently analyze them, and extract business and socially relevant information. The key objective of this course is to familiarize students with most important information technologies used in manipulating, storing, and analyzing big data.

Course Objective: To familiarize the students with important Information Technologies used in manipulating, storing, and analyzing big data.

Pre-requisite: Programming Language, like SQL, and exposure to Linux Environment.

Course Outcome: After studying this course, students will be able to:

CO1: Identify Big Data and its Business Implications.

CO2: List the components of Hadoop and Hadoop Eco-System

CO3: Access and Process Data on Distributed File System

CO4: Manage Job Execution in Hadoop Environment

CO5: Develop Big Data Solutions using Hadoop Eco System

Pedagogy: The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, web-based resources as well as flipped class room teaching will be adopted.

Digital Image Processing	
Course Code: MCS-112 Contact Hours: L-3 T-0 P-2 Course Category: DEC	Credits: 4 Semester: 2

Introduction: Digital image processing deals with processing of images which are digital in nature. Some of the important applications of image processing in the field of science and technology include computer vision, remote sensing, feature extraction, face detection, forecasting, optical character recognition, finger-print detection, optical sorting medical image processing, and morphological imaging. This course will introduce various image processing techniques, algorithms and their applications.

Course Objectives:

- Learn digital image fundamentals.
- Be exposed to simple image processing techniques.
- Be familiar with image compression and segmentation techniques.
- Learn to represent image in form of features.

Pre-requisite: Basic Concepts of Mathematics

Course Outcome: After completion of the course, student will be able to:

CO1: Understand the need for image transforms, different types of image transforms and their properties.

CO2: Develop any image processing application.

CO3: Learn different causes for image degradation and overview of image restoration techniques.

CO4: Understand the need for image compression and to learn image compression techniques.

CO5: Learn different feature extraction techniques for image analysis and recognition

Pedagogy:

The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, web-based resources as well as flipped class room teaching will be adopted.

UNIT -I	11 Hours	
Introduction: Fundamentals of Digital Image Processing, Components of digital image processing system, Brightness adaptation and discrimination, light, Image sensing and acquisition, Image formation model, definition and some properties of two dimensional system. Spatial and gray level resolution, Zooming and shrinking, some basic relationships between pixels.		
Discrete 2D convolution, 2D discrete Fourier transform and its properties, Spectral density function. Sampling and quantization of images. Gray level transformations, sharpening spatial filters, Smoothing and Sharpening frequency domain filters. Smoothing and Sharpening frequency domain filters.		
UNIT- II	10 Hours	
 Image Restoration:Model of image degradation/ Restoration process, Noise models, Noise reduction in spatial domain and frequency domain, Adaptive filtering, Inverse filtering, Wiener filtering. Morphological Image processing: Basics, SE, Erosion, Dilation, Opening, Closing, Hit-or-Miss Transform, Boundary Detection, Hole filling, Connected components, convex hull, thinning, thickening, skeletons, pruning, Geodesic Dilation, Erosion, Reconstruction by dilation and erosion. 		
UNIT-III	10 Hours	
Lossless predictive coding Lossy compression: Lossy predictive coding, transform coding, wavelet coding. Image compression standards, CCITT, JPEG, JPEG 2000 Image Segmentation: Edge detection, Thresholding, Otsu's thresholding, Region growing, Fuzzy clustering, Watershed algorithm, Active contour methods, and Texture feature based segmentation, Wavelet based segmentation methods.		
UNIT- IV	11 Hours	
Feature Extraction from the Image: Boundary descriptors, Regional descriptors descriptors. Image Processing applications: Study of various formats of medical images, Study		
images in X-ray, MRI, CT imaging, Medical image enhancement and filtering. Me segmentation methods.

Reinforcement Learning	
Course Code: MCS-114 Contact Hours: L-3 T-0 P-2 Course Category: DEC	Credits: 4 Semester: 2

Introduction: Reinforcement learning is concerned with building programs that learn how to predict and act in a stochastic environment, based on past experience. It was applied in a variety of fields such as robotics, pattern recognition, personalized medical treatment, drug discovery, speech recognition, computer vision, and natural language processing. This course covers fundamental principles and techniques in reinforcement learning.

Course Objective:

- To provide an introduction to reinforcement learning and its practical applications
- To train the students to frame reinforcement learning problems and to tackle algorithms from dynamic programming, Monte Carlo and temporal-difference learning

Pre-requisite: Basic statistics and linear algebra, Python programming

Course Outcome: After completion of the course, student will be able to:

CO1: Understand key features of Reinforcement Learning (RL).

CO2: Decide, formulate, design, and implement given application as RL problem.

CO3: Implement common RL algorithms and evaluate them using relevant metrics.

Pedagogy:

Computer Vision	
Course Code: MCS-116 Contact Hours: L-3 T-0 P-2 Course Category: DEC	Credits: 4 Semester: 2

Introduction: This course briefs about image processing techniques required for computer vision, Image formation process, Image analysis, generate 3D model from Images, video processing and Image motion computation. Also introduces the computer vision techniques.

Course Objective: In this course students will learn basic principles of image formation, image processing algorithms and different algorithms for 3D reconstruction and recognition from single or multiple images (video). This course emphasizes the core vision tasks of sceneunderstanding and recognition. Applications to 3D modeling, video analysis, video surveillance, object recognition and vision based control will be discussed.

Pre-requisite: A course in Programming and Mathematics is a prerequisite to study this course.

Course Outcome: After completion of the course, student will be able to:

CO1: To understand and determine the basic image processing techniques and image formation models required for computer vision.

CO2: To understand and apply image pre-processing, edge detection and motion estimation

CO3: To classify, discover and perform shape representation, segmentation and object recognition techniques for various computer vision applications

CO4: To apply computer vision techniques in various real-world applications

Pedagogy:

Introduction: Image Processing, Computer Vision and Computer Graphics, What is Computer		
Vision - Low-level, Mid-level, High-level, Overview of Diverse Computer Vision		
Applications: Document Image Analysis, Biometrics, Object Recognition, Tracking, Medical		
Image Analysis, Content-Based Image Retrieval, Video Data Processing, Multimedia, Virtual		
Reality and Augmented Reality		
Image Formation Models: Monocular imaging system, Radiosity: The 'Physics' of Image		
Formation, Radiance, Irradiance, BRDF, color etc, Orthographic & Perspective Projection,		
Camera model and Camera calibration, Binocular imaging systems, Multiple views		
geometry, Structure determination, shape from shading , Photometric Stereo, Depth from		
Defocus, Construction of 3D model from images.		
UNIT- II 10 Hours		
Image Processing and Feature Extraction: Image Preprocessing, Image Representations		
(continuous and discrete), Edge detection.		
Motion Estimation: Regularization theory, Optical computation, Stereo Vision, Motion		
estimation, Structure from motion.		
UNIT-III 11 Hours		
Shape Representation and Segmentation: Contour based representation, Region based		
representation, Deformable curves and surfaces, Snakes and active contours, Level set		
representations, Fourier and wavelet descriptors, Medial representations, Multi Resolution		
analysis.		
Object recognition: Hough transforms and other simple object recognition methods, Shape		
correspondence and shape matching, Principal component analysis, Shape priors for		
recognition

Speech Processing and Speech Recognition	
Course Code: MCS-118 Contact Hours: L-3 T-0 P-2 Course Category: DEC	Credits: 4 Semester: 2

Introduction: Speech processing and speech recognition (MCS 211) is a post graduate level course which gives an introduction about Speech Fundamentals methods, speech analysis and detailed study of speech models for speech processing and speech recognition. Apart from classical algorithms this course also includes current State of the Art concepts such as role of Deep neural networks in this domain.

Course Objectives:

- Understand the fundamental concepts of speech processing
- Explore various speech models using different state of the art and current approaches.
- Study the role of Deep Neural Network in speech recognition

Pre-requisite: Fundamentals of Artificial Intelligence.

Course Outcomes: After completion of the course, student will be able to:

CO1: Understand Speech production system

CO2: Understand various speech Analysis techniques

CO3: Build speech Models using HMM

CO4: Appreciate deployment of Deep neural networks for Speech recognition systems

Pedagogy:

UNIT -I	11 Hours	
Basic Concepts of Speech Fundamentals: Articulatory Phonetics, Production and		
Classification of Speech Sounds; Acoustic Phonetics acoustics of speech production; Time		
Domain and Frequency Domain methods of Signal Processing, Short-Time Fourier		
Transform, Filter-Bank and LPC Methods.		
UNIT- II	10 Hours	
Speech Analysis: Features, Feature Extraction and Pattern Comparison Techniques: Speech		
distortion measures - mathematical and perceptual - Log Spectral Distance, Cepstral		
Distances, Weighted Cepstral Distances and Filtering, Likelihood Distortions, Spectral		
Distortion using a Warped Frequency Scale, LPC, PLP and MFCC Coefficients, Time		
Alignment and Normalization – Dynamic Time Warping, Multiple Time –	-	
UNIT-III	11 Hours	
Speech Modeling: Hidden Markov Models: Markov Processes, HMMs – E

Optimiz	ing Compilers
Course Code: MAI-106	Credits: 4
Contact Hours: L-3 T-0 P-2	Semester: 2
Course Category: DEC	

Introduction: This course provides the complete description about inner working of a compiler. This course focuses mainly on the design of compilers and optimization techniques. It also includes the design of Compiler writing tools. This course also aims to convey the language specifications, use of regular expressions and context free grammars behind the design of compiler.

Course Objectives:

- To Introduce the concepts of language translation and compiler design
- To impart the knowledge of practical skills necessary for constructing a compiler

Pre-requisite: Programming in C.

Course Outcomes: After completion of the course, student will be able to:

- CO1: Understand the concepts and different phases of compilation
- **CO2:** Apply various code optimizing transformations.
- **CO3:** Design a compiler for a small subset of C language.

UNIT -I	11 Hours	
Overview: Overview of Lexical analyzer, Syntax analyzer, Semantic analysis		
UNIT- II	10 Hours	
Intermediate code generation and Parallelization: Intermediate languages – Graphical		
representations, Three Address code, Quadruples, Triples. Assignment statements, Boolean		
expressions. Compiler Challenges for High-Performance Architectures, Dependence and its		
Properties, Parallelization and Vectorization		
UNIT-III	11 Hours	
Code Optimization and Generation: Principal sources of optimization, Loop	_	
Data flow analysis, Issues in the design of a code generator. A simple code ger	nerator.	
UNIT- IV	10 Hours	
Scheduling and Allocation: Scheduling, Register allocation & Assignment		
Case Studies: Case studies of compilers

Advanced Data Warehousing and Data mining	
Course Code: MAI-108	Credits: 4
Contact Hours: L-3 T-0 P-2	Semester: 2
Course Category: DEC	

Introduction: Data warehousing is a method of organizing and compiling data into one database, whereas data mining deals with fetching important data from databases. Data mining attempts to depict meaningful patterns through a dependency on the data that is compiled in the data warehouse.

Course Objective: The objective of the subject is to facilitate the student with the basics of Data Warehouse and Data Mining, to study algorithms and computational paradigms that allow computers to find patterns and regularities in databases, perform prediction and forecasting, and generally improve their performance through interaction with data.

Pre-requisite: Database systems.

Course Outcome: Upon successful completion of this course, students will be able to:

CO1: Understand Data preprocessing and data quality.

CO2: Extracts insights, monitor performance and improve decision making.

CO3: Interpret the implementation of Datawarehouse and analyze various preprocessing techniques.

CO4: Analyze algorithms for data mining.

UNIT -I	10 Hours	
Review of Data Warehousing: Introduction to Data Warehousing: Ev	olution of Data	
Warehousing, Data Warehousing concepts, Benefits of Data Warehousing, Comparison of		
OLTP and Data Warehousing, Why Have a Separate Data Warehouse, Problems of Data		
Warehousing. Data Warehousing Architecture Architecture: Operational Data and Data store,		
Load Manager, Warehouse Manager, Query Manager, Detailed Data, Lig		
Highly summarised Data, Archive/Backup Data, Meta-Data, 2-tier, 3-tier	and 4-tier data	
warehouse architecture	10.77

Recommendation Systems	
Course Code: MAI-110 Contact Hours: L-3 T-0 P-2 Course Category: DEC	Credits: 4 Semester: 2

Introduction: In the current age of information overload, recommender systems offer personalized access for users to efficiently search information and make choices online. This course introduces recommender systems' major concepts, methodologies, evaluation design, and user experiences. A variety of real-world applications are included, such as those deployed in e-commerce sites and social networks.

Course Objective:

- To understand the basic concepts such as user preference and prediction.
- To learn variety of typical recommendation approaches.
- To understand system evaluation design and metrics
- To get the knowledge of human roles in system implementation and user-centered evaluation.

Pre-requisite: Data structures and basic knowledge of programming languages like C, C++.

Course Outcome: Upon successful completion of this course, students will be able to:

CO1: Describe basic concepts behind recommender systems.

CO2: Explain a variety of approaches for building recommender systems.

CO3: Interpret the system evaluation methods from both algorithmic and users' perspectives **CO4:** Demonstrate the applications of recommender systems in various domains.

Pedagogy: The teaching-learning of the course would be organized through lectures, tutorials, assignments, projects/ presentations and quizzes. Faculty members strive to make the classes

assignments, projects/ presentations and quizzes. Faculty members strive to make the classes interactive so that students can correlate the theories with practical examples for better understanding. Use of ICT, web-based resources as well as flipped class room teaching will be adopted.

	UNIT -I	12 Hours	
Int	roduction and basic taxonomy of recommender systems (RSs), traditional	l and non-	
pei	personalized RSs, overview of data mining methods for recommender systems- similarity		
me	measures, classification, clustering, SVMs, dimensionality reduction, overview of convex and		
lin	linear optimization principles		
	Content-based recommendation High level architecture of content-based systems, Advantages		
	l drawbacks of content-based filtering, Item profiles, discovering features of	documents,	
	taining item features from tags, Representing item profiles, Methods for		
lea	rning user profiles, Similarity based retrieval, Classification algorithms.		
	UNIT- II	10 Hours	
	Collaborative Filtering (CF)-based RSs: a systematic approach Nearest-neighbor collaborative		
	filtering (CF), userbased and item-based CF, and comparison, components of neighborhood		
	thods (rating normalization, similarity weight computation, and		
nei	ghborhood selection), attacks on collaborative recommender systems.		
	UNIT-III	10 Hours	
	vanced topics: Network aspects of content RSs Recommender systems for vi		
	tribution. Implications of recommender systems in 5G wireless network		
-	imizing wireless network performance. Case studies (i) Joint content recommen		
	ntent caching in small cells wireless networks (ii) The interplay of RSs and	d User	
acc	cess point association.		
	UNIT- IV	10 Hours	
-	plications of RSs RSs for content media, social media and communities Music		
	s. Datasets. Group recommender systems. Social recommendations. Recommen		
	ends: link prediction models. Similarities and differences of RSs with task assignments	ignment in	
	bile crowd sensing, social network diffusion awareness in RSs.

Machine Lear	ning in Cyber Security
Course Code: MIS-118	Credits: 4
Contact Hours: L-3 T-0 P-2	Semester: 2
Course Category: DEC	

Introduction: We are witnessing numerous attacks on cyber systems. In this course, we shall study application of machine learning, the most popular branch of artificial intelligence, to detect attacks in cyberspace, thereby equipping the students with an important perspective to secure cyber systems.

Course Objective:

- Introduce cyber systems in different domains with the objective of securing cyber systems using machine learning.
- Help the students to engineer and build a secure cyber system using machine learning and deep learning.

Pre-requisite: Programming, Machine Learning.

Course Outcome: Upon successful completion of this course, students will be able to: **CO1:** Understand the key features (aspects) to extract from cyber systems from a securityperspective.

CO2: Apply the concepts of machine learning to secure cyber systems.

	UNIT -I	10 Hours
	roduction: Need for Machine Learning in Cyber Security. Network Security: tNets, BotNet Detection. Deep Packet Inspection. Intrusion Detection. Anomaly I	
	UNIT- II	10 Hours

CONVERSATIONAL AI

Course Code:MCS - 201 Contact Hours:L-3 T-0 P- 0 Course Category: DEC

Semester: 3

Credits: 3

Introduction: The science and art of creating conversational AI spans multiple areas in computer science. Throughout the course, students will learn advances in these areas to create state-of-the art conversational virtual assistants

Course Objective

- To provide clear understanding of state-of-the art conversational virtual assistants •
- To provide the knowledge and skills necessary to effectively design and develop virtual assistants using tools•

Pre-requisite: Machine Learning, Deep Learning

Course Outcome: After completion of the course, student will be able to:

CO1: Understand Basic Programming concepts to work with chat bots

CO2: Build and deploy domain specific chatbots

CO3: Integrate the Virtual Assistants with third party APIs

Pedagogy:

	UNIT I	11 Hours

HUMAN COMPUTER INTERACTION

Course Code:MCS 203 ContactHours: L-3 T-0 P-0 Course Category: DEC Credits: 3 Semester: 3

Introduction: Human Computer Interaction (HCI) is an interdisciplinary field that integrates theories and methodologies from computer science, psychology, design, and many other areas. This course provides a basic understanding of Human interfaces, their design principles, tools as well as interfaces through thought process.

Course Objectives:

- · Learn the foundations of Human Computer Interaction.
- Be familiar with the design technologies for computer interaction and guidelines for webuser interface.
- Learn the ecosystem and tools of mobile Human Computer interaction.

Pre-requisite: Programming skill in some programming language

Course Outcomes: After completion of the course, student will be able to:

CO1: Design and Development processes and life cycle of Human Computer Interaction.

CO2: Analyze product usability evaluations and testing methods.

CO3: Apply the interface design standards/guidelines for cross cultural and disabled users.

CO4: Categorize, Design and Develop Human Computer Interaction in proper architecturalstructures.

Pedagogy:

UNIT I

HCI foundations- Input-output channels, Human memory, Thinking: reasoning and problem solving, Emotion, Individual differences, Psychology and the design of interactive systems, Text entry devices, Positioning, pointing and drawing, Display devices, Devices for virtual reality and 3D interaction, Physical controls, sensors and special devices, Paper: printing and scanning Designing- Programming Interactive systems- Models of interaction, Frameworksand HCI, Ergonomics, Interaction styles, Elements of the WIMP interface, The context of the interaction, Experience, engagement and fun, Paradigms for interaction.

UNIT II

Cantered design and testing- Interaction design basics-The process of design, User focus, Scenarios, Navigation design, Screen design and layout, Iteration and prototyping, Design for non-Mouse interfaces, HCI in the software process, Iterative design and prototyping, Design rules, Principles to support usability, Standards and Guidelines, Golden rules and heuristics, HCI patterns Implementation support - Elements of windowing systems, Programming the application, Using toolkits.

UNIT III

10 hrs

10 hrs

User interface management systems, Evaluation techniques, Evaluation through expert analysis, Evaluation through user participation, Universal design, User support Models and Theories -Cognitive models, Goal and task hierarchies, Linguistic models, The challenge of display-based systems, Physical and device models, Cognitive architectures.

UNIT IV

10 hrs

Collaboration and communication - Face-to-face communication, Conversation, Text-based communication, Group working, Dialog design notations, Diagrammatic notations, Textual dialog notations, Dialog semantics, Dialog analysis and design Human factors and security - Groupware, Meeting and decision support systems, Shared applications and artifacts, Frameworks for groupware Implementing synchronous groupware, Mixed, Augmented and Virtual Reality.

ETHICS IN AI

Course Code:MCS - 205 Contact Hours: L-3 T-0 P-0 Course Category: DEC Credits: 3 Semester: 3

Introduction: An increased reliance on sophisticated AI systems for vital societal functions gives rise to ethical questions regarding usage and management. The course focuses on various areas of moral relevance for autonomous systems and AI. This course deals with various ethical aspects of AI systems to create a Trustworthy AI system.

Course Objective

- To Study the need for Trustworthiness of AI systems
- To understand the ethical aspects of AI systems to create a Trustworthy AI system.
- To study the algorithms to mitigate bias and algorithms on explain ability of ML systems.

Pre-requisite: Machine Learning

Course Outcome: After completion of the course, student will be able to

CO1: Understand the ethical issues in artificial intelligence (AI)·

CO2: Analyze an AI/ML system for its explain ability, robustness and fairness.

CO3: Understand the role of AI systems in the context of Human Society and Trusted decision making.

Pedagogy:

COGNITIVE CON	MPUTING
Course Code: MCS 207	Credits: 3
Contact Hours: L-3 T-0 P-0	Semester: 3
Course Category: DEC	

Introduction: This course explores the area of cognitive computing and its implications for today's world of big data analytics and evidence-based decision making. Topics covered include: cognitive computing design principles, natural language processing, knowledge representation, Students will have an opportunity to build cognitive applications, as well as explore how knowledge-based artificial intelligence and deep learning are impacting the field of data science.

Course Objective: To develop algorithms that use AI and machine learning along with human interaction and feedback to help humans make choices/decisions and to understand how Cognitive computing supports human reasoning by evaluating data in context and presenting relevant findings along with the evidence that justifies the answers.

Pre-requisite: A course on AI

Course Outcome: After completing this course, the students will be able to:

CO1: Understand basics of Cognitive Computing and its differences from traditional Approaches of Computing.

CO2: Plan and use the primary tools associated with cognitive computing.

CO3: Plan and execute a project that leverages Cognitive Computing.

Pedagogy:

	UNIT I	10 Hours

	ROBOTICS AND AP	PLICATIONS
Course Code: MCS 20)9	Credits: 3
Contact Hours: L-3 T-0	P-0	Semester: 3
Course Category: DEC		

Introduction: The study of robotics concerns itself with the desire to synthesize some aspects of human function by the use of mechanisms, sensors, actuators, and computers. This subject provides an important background material to students involved in understanding the basic functionalities of robotics.

Course Objectives:

- · Learn types of robotics, fundamentals of robotics
- · Learn languages used to program robots
- · Learn sensing system for a robot and safety of robots.

Pre-requisite: Basic concepts of mathematics

Course Outcomes: After completing this course, the students will be able to:

CO1: Understand the basics of robotics and its fundamentals.

CO2: Understand deploying robotics applications and sensor nodes.

CO3: Understand usage of robotics principles in real life environment.

Pedagogy:

	UNIT I	10 hrs
Int	roduction to Robotics: Classification of Robots, Characteristics and performance,

DATA ANALYTICS AND VISUALIZATION

Course Code:MAI 201 Contact Hours: L-2 T-0 P-02 Course Category: DEC Credits: 3 Semester: 3

Introduction: Data visualization is the graphical representation of information and data in a pictorial or graphical format. Data analytics is the process of analyzing data sets in order to make decision about the information they have, increasingly with specialized software and system.

Course Objectives:

- Familiarize how data can be presented to various stakeholders.
- Understand the lifecycle of data analysis.
- · Understand the concepts of Predictive modelling
- Understand different data visualization techniques.

Pre-requisite: Mathematical Foundation for Data Science

Course Outcomes: After completing this course, the students will be able to:

CO1: Identify and understand different techniques for data analysis.

CO2: Interpret the lifecycle of data analysis from understanding to deployment.

CO3: Analyze and demonstrate predictive modeling and its applications.

CO4: Create effective data visualization using different visualization tools and techniques to visualize data.

CONTENTS	
UNIT I	12 hrs
Data Analytic Thinking: The Ubiquity of Data Opportunities, Data Processing and "Big Big Data 1.0 to Big Data 2.0, Data and Data Science Capability as a Strategic Asset, Busi to Data Mining Tasks, Business Understanding.	
UNIT II	10 hrs
Data Analytics : Data Understanding, Data Preparation, Modeling, Evaluation, Deploym techniques and technologies, Importance of context, Choosing an effective visual, Dissec visuals, Case studies.	•
UNIT III	10 hrs
Introduction to Predictive Modelling: Sample data, Learn a model, Make predictions, So Applications of Predictive Modeling.	ome
UNIT IV	10 hrs
Data visualization techniques: Univariate and Multivariate plots, pros and convisualization, Data Visualization Tools, Case studies.	ns of data
Text Books

BLOCKCHAIN FUNDAMENTALS

Course Code:MIS 211 Contact Hours: L-2 T-0 P-2 Course Category: DEC

Credits: 3 Semester: 3

Introduction: Blockchain can be described as a data structure that holds transactional records and while ensuring security, transparency, and decentralization. You can also think of it as a chain or records stored in the forms of blocks which are controlled by no single authority. A blockchain is a distributed ledger that is completely open to any and everyone on the network. Once an information is stored on a blockchain, it is extremely difficult to change or alter it. Blockchain andCryptocurrency is vastly discussed now days in all research domains to bring the decentralization. This course is to understand Blockchain and its main application cryptocurrency.

Course Objectives:

- To build expertise in Blockchain and Distributed Ledger Technology
- To understanding basics of Cryptocurrency Bitcoin
- To understanding Smart Contracts

Pre-requisite: Basics of Elliptic Curve Cryptography, Decentralized and Distributed Computing, Peer-to-Computing, distributed Computing, Basic knowledge of programming.

Course Outcome: The students will be able to

CO1: Get expertise in Blockchain and Distributed Ledger Technology

CO2: Get Hands-on PoC experience across major Blockchain Platforms

CO3: Exposure to Blockchain Use Cases across Domains

Pedagogy:

UNIT I	7 hrs
Basics: Distributed Database, Two General Problem, Byzantine General problem and	l Fault
Tolerance, Hadoop Distributed File System, Distributed Hash Table, ASIC resistance	e, Turing
Complete.	
Cryptography: Hash function, Digital Signature - ECDSA, Memory Hard Algorithm, Knowledge Proof.	, Zero
UNIT II	7 hrs
Blockchain: Introduction, Advantage over conventional distributed database, Blockc	hain Network,
Mining Mechanism, Distributed Consensus, Merkle Patricia Tree, Gas Limit, Transa	ctions and Fee,
Anonymity, Reward, Chain Policy, Life of Blockchain application, Soft & Hard Fork	k, Private and
Public blockchain	
UNIT III	7 hrs
Distributed Consensus: Nakamoto consensus, Proof of Work, Proof of Stake, Proof of	of Burn,
Difficulty Level, Sybil Attack, Energy utilization and alternate.	
Cryptocurrency: History, Distributed Ledger, Bitcoin protocols - Mining strategy and Ethereum - Construction, DAO, Smart Contract, GHOST, Vulnerability, Attacks, Sic	
coin
